

ZL Discovery Manager

Take control of the left-hand side of EDRM with ZL Tech's eDiscovery and compliance solutions.

Searching beyond predefined custodians, ZL Tech investigates the entire enterprise of data that lies beneath the surface.

Traditional eDiscovery methods that scour countless data silos pose difficulties to IT and legal teams, who are forced to perform repetitive searches to collect relevant findings. This approach often results in delayed collection and frequently misses crucial evidence that does not fit into narrow search parameters.

Searching the Beach

ZL Tech offers a fundamentally new approach to eDiscovery built on a solid information governance framework. Instead of relying on pre-defined custodians and searching their respective data repositories, known as "sandboxes," ZL Tech enables organizations to search the entire enterprise for relevant findings—before custodians have even been identified.

ZL's In-Place Data Management enhances the eDiscovery process, giving organizations a strategic advantage in litigation. Instead of relying on limited, sandbox-based searches, ZL enables deep, enterprise-wide searches across the full "beach" of unstructured data—email, file shares, chats, and more. This approach uncovers an order of magnitude more "smoking guns"—key pieces of evidence that can shift the outcome of a case. With this capability, legal teams essentially **weaponize eDiscovery**—gaining leverage in keyword negotiations and increasing the likelihood of early wins or favorable settlements. During internal investigations, organizations can confidently and securely search all unstructured data to quickly find exactly what they need.

True Unified Governance

ZL Tech hosts all data sources in a single platform for eDiscovery, compliance, records management, and analytics. With all data in one place, users can conduct global searches in a matter of seconds that produce more relevant findings than traditional methods due to ZL Tech's complete control over document metadata and content. Despite identifying more relevant findings, ZL Tech's refined search capabilities and false positive reduction result in a 40% decrease in the number of documents that reach review.

ZL Discovery Manager gives legal teams a strategic advantage with day one early case assessment, granular search with false-positive reduction, built-in review analytics, and automated preservation for efficient, defensible eDiscovery. Save upwards of 23% on total eDiscovery costs and gain a legal edge by switching to ZL Tech.

1

Petabytes of data managed by a single platform

2

In-Place

No unneeded copies, only archive essential records

3

Governance

Automated Unified Governance to satisfy regulatory & legal requirements

4

Curation

Reduce storage costs by 30% with periodic defensible deletion

5

Speed

Accelerate time to relevant data by 1000x

Weaponizing eDiscovery

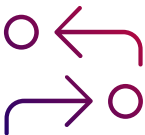

Early Case Strategy

Win or lose early by starting case assessment from day one. ZL Tech enables organizations to search the enterprise—beyond predefined custodians—to explore relevant documents and uncover case trends. Pairing these initial findings with ZL Tech's built-in analytics, data visualizations, and hit term reports, legal teams can rein in unnecessary search criteria during key term negotiations. Promptly understanding the facts of a case allows organizations to gain a strategic advantage when crafting legal strategies.

Focused Collection

Arm your legal team with all relevant findings using ZL Tech's global search. Users can cull the entire enterprise in seconds with a singular, granular search that combines any number of complex criteria: Boolean logic, wild card expansions, fuzzy logic, proximity rules, and more. ZL Tech further narrows document collection by omitting false positives with message threading and deduplication technology.

Streamlined Review

Provide legal teams with a comprehensive view of findings for deeper case insight. ZL Tech allows users to peer into documents—with relevant text automatically highlighted—to appraise their case value prior to export. Message threading further enables reviewers to see findings in context by showing what initiated and followed the conversation. Understanding the efficacy of search results before exporting documents enables legal teams to go back and quickly narrow or broaden search criteria as required.

Defensible Case Preservation

Reduce legal and IT teams' workloads with automated legal holds, document preservation, and audit trails. Once custodians are identified, they can be placed on real-time legal holds, sent questionnaires, and given next steps with a single click. For ongoing data preservation and collection, newly created documents that match existing criteria are automatically added to the case. ZL Tech proves chain of custody by capturing every action taken on case findings in its audit trails. Once finished, accurate export allows users to confidently hand off data for right-hand eDiscovery.
